Mayor Phillip Burch City of Artesia P.O. Box 1310 Artesia, New Mexico 88211

Re: City of Artesia Waste Water Treatment Plant; Major-Municipal; NPDES Compliance Sampling Inspection; SIC 4952; NPDES Permit NM022268; February 11, 2015

Dear Mr. Burch:

Enclosed please find a copy of the report and check list for the referenced inspection that the New Mexico Environment Department (NMED) conducted at your facility on behalf of the U.S. Environmental Protection Agency (USEPA). This inspection report will be sent to the USEPA in Dallas for their review. These inspections are used by USEPA to determine compliance with the National Pollutant Discharge Elimination System (NPDES) permitting program in accordance with requirements of the federal Clean Water Act.

You are encouraged to review the inspection report, required to correct any problems noted during the inspection, and advised to modify your operational and/or administrative procedures, as appropriate. If you have comments on or concerns with the basis for the findings in the NMED inspection report, please contact us (see the address below) in writing within 30 days from the date of this letter. Further you are encouraged to notify in writing both USEPA and NMED regarding modifications and compliance schedules at the addresses below:

Racquel Douglas US Environmental Protection Agency, Region VI Enforcement Branch (6EN-WM) Fountain Place 1445 Ross Avenue Dallas, Texas 75202-2733 Bruce Yurdin New Mexico Environment Department Surface Water Quality Bureau Point Source Regulation Section P.O. Box 5469 Santa Fe, New Mexico 87502 Mayor Burch Page 2 March 4, 2015

If you have any questions about this inspection report, please contact Daniel Valenta at (505) 827-2575 or at <a href="mailto:daniel.valenta@state.nm.us">daniel.valenta@state.nm.us</a>.

Sincerely,

/s/Bruce Yurdin

### Introduction

On February 11, 2015 a Compliance Sampling Inspection (CSI) was conducted at the City of Artesia Wastewater Treatment Plant (WWTP) by Daniel Valenta of the State of New Mexico Environment Department (NMED), Surface Water Quality Bureau (SWQB). The inspection was conducted by NMED for the US Environmental Protection Agency (USEPA), Region VI, under the National Pollutant Discharge Elimination System (NPDES) permit program, in accordance with the Federal Clean Water Act. These inspections are conducted under contract with the USEPA and are used by USEPA to evaluate compliance with the NPDES permit program. This inspection report is based on information supplied by the City of Artesia representatives (the permittee), observations made by the NMED inspectors, reports and records kept by the permittee and/or NMED.

The Artesia WWTP is classified as a major municipal discharger under the Federal Clean Water Act (CWA), section 402 NPDES permit program, and is assigned NPDES permit number NM0022268. The Standard Industrial Classification Code (SIC) is 4952.

The facility is permitted for a design flow of 2.6 Million Gallons per Day (MGD). The plant was originally built to treat 1.3 MGD of wastewater. A second treatment train, identical to the original was built a few years later. The discharge for the WWTP enters the Pecos River in Water Quality Segment 20.6.4.206 NMAC. The Designated Uses for this segment of the river are: irrigation, livestock watering, wildlife habitat, secondary contact and warmwater aquatic life.

### **Inspection Details**

The inspector arrived at the Artesia WWTP at 0934 hours and met with Ms. Patsy Hernandez, Lead Operator; the inspector showed his credentials and explained the purpose of the inspection. Mr. Jerry Whitehead, Wastewater Supervisor, joined us shortly afterward. After a tour of the facility a records review, and laboratory inspection was conducted. An exit interview was conducted with Mr. Jerry Whitehead and Ms. Patsy Hernandez, the inspector left the facility at 1530 hours.

#### **Treatment Scheme**

Raw Sewage is delivered to the City of Artesia Wastewater Treatment Plant (WWTP) through a collection system that extends 56 miles with five lift stations. The service area is slightly more than two square miles and includes a population of approximately 11,301 persons. Contributing industries include: Navajo Refining Company LLC, oil and gas industry support businesses, restaurants, hotels, carwashes, gas stations, laundromats, schools and the Federal Law Enforcement Training Center.

A septage receiving station is located at the WWTP wet well before the raw sewage enters the treatment works. At the head of the treatment plant, the influent gravity flows to the first of two automatic bar screens for large solids removal. The majority of the treatment units are above ground due to the high water table in the area. Following the first bar screen are a set of Flygt pumps that lift the sewage to the second bar screen and to the influent flow measurement Parshall flume with a staff gauge and a Drexelbrook differential pressure sensor that records the totalized flow. The original plant design had only one bar screen located after the Flygt pumps. Large solids were damaging to the pumps so the additional bar screen was built. Following that is a rectangular aerated grit removal chamber. The solids removed from the screens and from the grit chamber are dried and after passing the paint filter test, disposed of at the county landfill between Carlsbad and Hobbs, New Mexico. The treatment plant is monitored with a SCADA control system. An alarm call out system is in place with the operators' phone numbers programed in. The facility has a backup diesel generator for power that is exercised weekly.

Following grit removal, the liquid waste is sent to one of four race track design oxidation ditches, extended air treatment units. These are built as two parallel trains. Each train can also be run parallel. At the time of the inspection, all four race tracks - oxidation ditches were in operation. The oxidation ditches are run through four phases a day lasting eight hours each. The cycles rotate between aerobic and anaerobic, mixing and settling. Following the oxidation ditches are two secondary clarifies, one each for the separate treatment trains. Solids are wasted from the oxidation ditches and the secondary clarifiers. Return Activated Sludge (RAS) from the secondary clarifier is sent back to the head of the plant. Decants from the secondary clarifiers are sent to the ultraviolet disinfection system, consisting of a single channel with three banks of lights. Following disinfection is the effluent flow meter Parshall flume with a staff gauge and a Drexelbrook differential pressure sensor that records the totalized flow. The effluent flow meter is not installed correctly and though was recording measurements, was not being used for NPDES reporting. The influent flow was being used for reporting at the time of the inspection.

Beyond the effluent flow measurement is a splitter well that can direct the effluent to either the outfall at the Pecos River or to a reuse holding pond. The outfall at the Pecos River is through an enclosed pipe approximately ½ to 1 mile to the North East. A rough rock structure has been installed at the outfall location to stabilize the soils, prevent erosion and to enhance aeration of the treated water as it enters the river.

The reuse water is sent to parks in the city. Solids wasted from the treatment units are sent through a belt filter press where a polymer is added for dewatering. They are then dried in concrete beds with under drains, mixed with mulch to achieve Class A quality as defined under the 40 CFR 503 sludge regulations for compost and used on parks in the City of Artesia. The under drains that collect the liquids are plumbed so liquids are sent back to the head of the treatment plant.

### Finding

The facility is permitted for a design flow of 2.6 Million Gallons per Day (MGD). The plant was originally built to treat 1.3 MGD of wastewater. A second treatment train, identical to the original was built a few years later. The NPDES effluent limit loading values in pounds per day were based on the original plant design capacity of 1.3 MGD. The current facility is designed to treat 2.6 MGD. The facility has not gone through an Antidegredation review therefore, all effluent loading values are based on the previous design of 1.3 MGD, the facility has been able to meet its loading limits. It primarily discharges effluent during the months of October, November, and December when reuse is at the lowest.

According to the permit application for the City of Artesia WWTP signed January 30, 2012, the influent flow from the Navajo Refinery will be a combination of process wastewater and non-process wastewater. The indicated average daily volume of process wastewater is 0.0216 MGD. This will be combined with 0.2160 MGD non-process wastewater, a mixing of 10 to 1, see attached Part F Supplemental Application Information.

In a letter dated May 27, 2014, Update on Selenium Removal Technologies and Understanding between Navajo Refining Company, L.L.C. ("Navajo") and the City of Artesia("City") regarding the Wastewater Service Agreement by and between Navajo and City, Dated June 25, 2013 (the "Agreement"), see attached. Two technologies were chosen during fall 2013 for testing and potential implementation by Navajo to reduce Selenium in its waste stream. In addition to the trials Navajo has been adding reverse osmosis ("RO") reject water to the Refinery's wastewater treatment system at approximately 70 Gallons per Minute or 0.1008 Million Gallons per Day.

#### Per 40 CFR 403.6(d)

(d) Dilution prohibited as substitute for treatment. Except where expressly authorized to do so by an applicable Pretreatment Standard or Requirement, no Industrial User shall ever increase the use of process water, or in any other way attempt to dilute a Discharge as a partial or complete substitute for adequate treatment to achieve compliance with a Pretreatment Standard or Requirement. The Control Authority may impose mass limitations on Industrial Users which are using dilution to meet applicable Pretreatment Standards or Requirements, or in other cases where the imposition of mass limitations is appropriate.

The October 2014 monthly average flow contribution from the Navajo Refining Company LLC is recorded as .173 MGD. This industrial contribution is approximately 12 % of the wastewater being treated at the City of Artesia WWTP at that time. If an increase of influent from the Navajo Refining Company LLC is expected to be above the amount identified in the permit application 0.238 MGD, notice must be given to EPA and NMED prior to that increase.

### Section D-Self-Monitoring-Overall Rating of "Unsatisfactory"

The permit requires in Part III. C. Monitoring and Records.

2. Representative Sampling

Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

### **Finding:**

- 1. The loading calculations on the Discharge Monitoring Reports (DMRs) are not being done with effluent flow readings. The facility is using the influent flow reading, not the required effluent flow reading. This may not reflect the true loading discharge flow.
  - Flow on day of sampling (MGD) x concentration (mg/L) x 8.34 (lbs/gal) = Loading (lbs/day)
- 2. The EPA is encouraging permittees to transition from submitting DMRs as paper copies to the NetDMR system. Information on the NetDMR training can be found at: <a href="http://epa.gov/netdmr/about/training.html">http://epa.gov/netdmr/about/training.html</a> additionally, the State conducts classes on a periodic basis, through the Operator Certification Schools. Facility personnel are encouraged to attend these training sessions.

### Section E-Flow Measurement – Overall Rating of "Unsatisfactory"

The permit requires in Part III C. 6. FLOW MEASUREMENTS:

Appropriate flow measurement devices and methods consistent with accepted scientific practices shall be selected and used to ensure the accuracy and reliability of measurements of the volume of monitored discharges. The devices shall be installed calibrated, and maintained to insure that the accuracy of the measurements is consistent with the accepted capability of that type of device. Devices selected, shall be capable of measuring flow with a maximum deviation 10% from true discharge tares throughout the range of expected discharge volumes.

#### **Findings:**

The effluent flow meter is not installed correctly and cannot be used to measure or to report effluent flow volumes and pollutant loading values. The influent flow meter flow values are being used for reporting purposes. Using influent flow reading, not the required effluent flow, may not reflect the true discharge flow.

### **Section I -Sampling Inspection Procedure**

As part of this inspection an effluent sample was collected after the final treatment unit. The sample was collected by hand at the effluent flume, see photo 3. The one liter polyethylene container was pretreated with nitric acid (HNO3) to lower the pH < 2; the sample will be tested for metals. It was then placed in an insulated box and locked in the State vehicle to ensure the integrity of the sample. A chain of custody form was employed. On February 12, 2015 the sample was delivered to and is currently being analyzed at the NM Department of Health's Scientific Laboratory Division in Albuquerque, NM. When sampling results are received, copies of the results will be sent under separate letter to EPA and to the facility.

### Photo #1

Photographer: Daniel Valenta	Date: 2/11/2015	Time: 1032 hours
City/County: Artesia WWTP/E	ddy County	

Location: 1702 North Haldeman Rd, Artesia, NM 88210

Subject: Headworks of WWTP, influent flow is measured at this strip of metal. The operator did not know if the meter had ever been calibrated or the details of its operation.

# Photo # 2

Photographer: Daniel Valenta	Date: 2/11/2015	Time: 1033 hours
City/County: Artesia WWTP/E		

Location: 1702 North Haldeman Rd, Artesia, NM 88210

Subject: Headworks of WWTP, there was a staff gauge present that could be used to check the measurements of the flow meter.

# Photo #3

Photographer: Daniel Valenta	Date: 2/11/2015	Time: 1010 hours
City/County: Artesia WWTP/E		

Location: 1702 North Haldeman Rd, Artesia, NM 88210

Subject: Effluent flume of WWTP, due to the alignment of the discharge pipe water backs up into the flume giving inaccurate flow reading.

### Photo #4

Photographer: Daniel Valenta	Date: 2/11/2015	Time: 1038 hours
City/County: Artesia WWTP/E	ddy County	

Location: 1702 North Haldeman Rd, Artesia, NM 88210

Subject: One of the aeration basins, solids appeared to be old. Note compose piles in the background, these are used around the City of Artesia.

### SUPPLEMENTAL APPLICATION INFORMATION

# INDUSTRIAL USER DISCHARGES AND RCRA/CERCLA WASTES PART F. All treatment works receiving discharges from significant industrial users or which receive RCRA, CERCLA, or other remedial wastes must complete Part F. **GENERAL INFORMATION:** F.1. Pretreatment Program. Does the treatment works have, or is it subject to, an approved pretreatment program? Yes ✔ No F.2. Number of Significant Industrial Users (SIUs) and Categorical Industrial Users (CIUs). Provide the number of each of the following types of industrial users that discharge to the treatment works. a. Number of non-categorical SIUs. 1.00 b. Number of CIUs. SIGNIFICANT INDUSTRIAL USER INFORMATION: Supply the following information for each SIU. If more than one SIU discharges to the treatment works, copy questions F.3 through F.8 and provide the information requested for each SIU. F.3. Significant Industrial User Information. Provide the name and address of each SIU discharging to the treatment works. Submit additional pages as necessary. Navajo Refining Company Name: Mailing Address: PO Draw 159 Artesia, New Mexico 88211 F.4. Industrial Processes. Describe all of the industrial processes that affect or contribute to the SIU's discharge. Petroleum Refining Principal Product(s) and Raw Material(s). Describe all of the principal processes and raw materials that affect or contribute to the SIU's discharge. Gasoline, Diesel, Jet Fuel, Asphalt Principal product(s): Crude Oil Raw material(s): F.6. Flow Rate. a. Process wastewater flow rate. Indicate the average daily volume of process wastewater discharged into the collection system in gallons per day (gpd) and whether the discharge is continuous or intermittent. 21,600.00 continuous or \_\_\_\_\_intermittent) b. Non-process wastewater flow rate. Indicate the average daily volume of non-process wastewater flow discharged into the collection system in gallons per day (gpd) and whether the discharge is continuous or intermittent. ✓ continuous or \_\_\_\_\_intermittent) 216,000.00 gpd F.7. Pretreatment Standards. Indicate whether the SIU is subject to the following: a. Local limits Yes b. Categorical pretreatment standards ✓ Yes If subject to categorical pretreatment standards, which category and subcategory? (40 CFR 419.17) Pretreatment Standards for new sources

### SUPPLEMENTAL APPLICATION INFORMATION

#### PART G. COMBINED SEWER SYSTEMS

If the treatment works has a combined sewer system, complete Part G.

- G.1. System Map. Provide a map indicating the following: (may be included with Basic Application Information)
  - a. All CSO discharge points.
  - b. Sensitive use areas potentially affected by CSOs (e.g., beaches, drinking water supplies, shellfish beds, sensitive aquatic ecosystems, and outstanding natural resource waters).
  - c. Waters that support threatened and endangered species potentially affected by CSOs.
- **G.2.** System Diagram. Provide a diagram, either in the map provided in G.1, or on a separate drawing, of the combined sewer collection system that includes the following information:
  - a. Locations of major sewer trunk lines, both combined and separate sanitary.
  - b. Locations of points where separate sanitary sewers feed into the combined sewer system.
  - c. Locations of in-line and off-line storage structures.
  - d. Locations of flow-regulating devices.
  - e. Locations of pump stations.

May 27, 2014

The Honorable Phillip Burch Mayor, City of Artesia P.O. Box 1310 Artesia, New Mexico 88211-1310

Re:

Update on Selenium Removal Technologies and Understanding between Navajo Refining Company, L.L.C. ("Navajo") and the City of Artesia ("City") regarding the Wastewater Service Agreement by and between Navajo and City, dated June 25, 2013 (the "Agreement")

### Dear Mayor Burch:

This letter (1) provides an update on the status of selenium removal technologies at Navajo's Artesia Refinery, (2) memorializes the understanding reached between Navajo and the City regarding the date for Navajo's compliance with certain Discharge Limits in the above-referenced Agreement and (3) amends the Agreement accordingly.

### Selenium Removal Technologies

Navajo has been working with CH2M HILL since 2012 to assess and evaluate different selenium treatment options at its Artesia Refinery. Two technologies were chosen during fall 2013 for testing and potential implementation by Navajo: iron co-precipitation (ICP) and SeRT® (Selenium Removal Technology).

On November 26, 2013, Navajo completed installation of the equipment necessary to conduct a scale-up trial of the ICP process at the Refinery's wastewater treatment system ("WWTS"). The trial commenced on November 27, 2013 and concluded on January 31, 2014. This trial enabled Navajo to evaluate associated technical problems with this technology, and the results showed that ICP efficiently removed selenium across the system at an average rate of approximately 73%. On February 1, 2014, Navajo moved the trial to full-scale operation with continuous addition of ferric chloride at an iron dose of 50 mg/L.

Navajo has also expedited the installation of SeRT®. This technology was developed by Phillips 66 to remove selenocyanate from aqueous streams. Based on previous testing, most of the selenium in the Refinery's aqueous, sour water process streams is in the form of selenocyanate. Phillips 66 performed bench scale-testing for Navajo in spring 2013, and Navajo is first assessing this technology using an existing (trial) 100 gpm SeRT® unit on the Refinery's sour water process streams. Mechanical completion of the trial unit occurred on January 17, 2014 and the unit began operating on January 31, 2014. Stable operation of the trial SeRT® unit was achieved on March 20, 2014, and the trial results through April 21 indicate an average total selenium removal efficiency of 92%. Based on the results of the SeRT® trial, Navajo may install a full capacity, permanent 200 gpm SeRT® unit or modify the existing 100 gpm trial SeRT® unit. Process engineering for a full capacity permanent unit was completed in mid-February 2014. Based on the SeRT® process results, Navajo will consider discontinuing use of the ICP process.

Navajo is also still evaluating other selenium removal technologies and their possible implementation at the Refinery.

In addition to the ICP and SeRT® trials, Navajo has been adding reverse osmosis ("RO") reject water to the WWTS (at approximately 70 gpm). As part of other Refinery activities, Navajo plans to continue adding some RO reject water to the wastewater collection system.

### Amendment to Wastewater Service Agreement

Navajo and the City entered into the Agreement for the discharge of a portion of Navajo's wastewater effluent into the City's publicly owned treatment works ("POTW") under the terms and conditions in the Agreement. The Agreement sets forth certain Discharge Limits, including a Daily Maximum limit of 0.024 mg/L and Monthly (30-Day) Average limit of 0.014 mg/L for total selenium.

Effective September 1, 2013, the United States Environmental Protection Agency (EPA) renewed NPDES Permit No. NM0022268 (the "NPDES Permit") governing wastewater discharges from the City's POTW. The NPDES Permit establishes a Daily Maximum limit of 7.4 μg/L and a 30-Day Average limit of 5.0 μg/L for total selenium and includes a compliance schedule that allows the City at least three years from the NPDES Permit's effective date to meet these selenium discharge limitations. The City is also required to implement actions to control selenium in its discharge and, as part of that effort, is conducting a Local Limits Study.

Based on Navajo's ongoing efforts to test and implement selenium reduction technology at the Refinery, the compliance schedule for achieving the selenium limits in the City's NPDES Permit, and the City's on-going Local Limits Study under the conditions of the NPDES Permit, Navajo requested that the City provide it with interim relief from the total selenium limits under the Agreement. The City was willing to grant such relief, provided that Navajo would be subject to interim limits for total selenium that would be calculated in accordance with EPA's Local Limits Development Guidance and the Region 8 Local Limits Spreadsheet, taking into account the New Mexico Water Quality Control Commission groundwater standard for selenium, and the sewage sludge quality standard in the NPDES Permit. Based on these considerations, CH2M HILL calculated interim limits for total selenium as set forth in the Technical Memorandum attached hereto.

In light of the foregoing, Navajo and the City agree to amend the Agreement as follows:

Paragraph E(2) is hereby amended and restated in its entirety to read as follows:

#### (2) Quality:

- (a) With the exception of selenium, the quality of the Non-Domestic Wastewater or Industrial Wastewater delivered to the City shall be governed by the Discharge Limits as set forth in Attachment 1.
- (b) Effective as of June 25, 2013, and until August 31, 2015, Navajo shall comply with the following discharge limits for selenium: 0.50 mg/L Daily Maximum, 0.035 mg/L Monthly Average.
- (c) On and after September 1, 2015, Navajo shall comply with the Discharge Limits for selenium in Section 2.2 of Attachment 1 to the Agreement.

Sincerely,

Michael G. McKee Vice President & Refinery Manager

ACCEPTED AND AGREED TO:

Michael G. McKee

Vice President & Refinery Manager Navajo Refining Company, L.L.C.

Artesia, NM 88210 (575) 748-3311

Date: 28 May 2014

Phillip Burch, Mayor For City of Artesia, New Mexico

Artesia, NM 88210 (575) 746-2122
